Security Architecture

Authentication

```
Web UI ........... Django session login (/login/, /register/).
REST API ......... DRF TokenAuthentication (Authorization: Token)
MEC agents ....... MECAuthentication: DRF token + X-MEC-ID header;
                   heartbeat body carries auth_token.
```

Device lifecycle

```
PairingCode (admin) -> register -> auto device_id (MEC-001...).
Revocation blocks a device instantly; ONLINE/REVOKED logic keeps
revoked twins out of the scheduler and requeues their tasks.
```

Attack simulation (no real attacks)

```
/api/security/attack/ runs fake attacker profiles against the DUAL
security model (cost + privacy + trust + SLA + risk):
    benign, ddos, data_breach, ransomware, zero_day.
Dashboard + Security Monitor show live threat level + per-node flags.
Storage attack page: unauthorised encryption attempts on the cloud
simulator can be guarded (recover endpoint resets integrity).
```
