SecureDT - API & Configuration Guide

config.yaml, environment variables and telemetry wiring

No API keys required for offline/synthetic operation.

Configuration precedence

- Environment variables: SECRET_KEY, PORT, ZEEK_LOGS_DIR
- config.yaml next to config.py (see config.yaml.example)
- Defaults inside config.py

config.yaml example

```
server: { port: 8080 }
ga: { population: 40, generations: 50 }
security:{ rate_limit_per_min: 60, upload_max_rows: 100000 }
data_source: { label: "SIMULATION DATA" }
```

Optional live telemetry

The TelemetryAdapter reads Zeek log dirs (conn/dns/http/...) when configured; otherwise /api/telemetry/status reports simulation mode with a clear message. The UI never fails on a missing adapter.
