SecureDT - Experiment Guide

Algorithm comparison campaigns and export

Run all four schedulers on a shared workload to compare success rate, latency, energy, privacy exposure and security risk.

Algorithms

- random - arbitrary placement
- greedy - best local score per step
- privacy_aware - most-trusted best-available node
- proposed_ga - the security-aware GA in engine/scheduler

How to read the results

- Success rate dominates - dropped deadlines rule out a run
- privacy_aware and proposed_ga beat random/greedy on privacy exposure and security risk
- The GA should match or beat greedy on deadline success

Reproducibility & export

Campaigns are seeded; results append to experiment_results_2000.csv and are visible in /analytics and via /api/export/experiments.
